

FL-01: AI Workflow Audit and Tool Setup

Anil Mali | AI & Data Science, KLE College of Engineering & Technology (VTU) | ML Intern, FlyRank AI

1. Task Classification Table

#	Task	Classification	Rationale
1	Attending VTU lectures / labs for AI & DS coursework	Just me	Learning happens by doing the thinking myself; outsourcing comprehension defeats the point of the degree.
2	Solving problem sets / assignment derivations for coursework	Just me	Grades and exams test my own understanding, not AI's — using it here would hide gaps I need to know about.
3	Writing PyTorch training/eval scripts for FlyRank ML tasks	Collaborate with AI	I know the ML logic I want but AI speeds up boilerplate (data loaders, training loops); I still design the architecture and check outputs.
4	Debugging n8n workflow errors in LeadGenius AI	Collaborate with AI	Error messages are often cryptic; AI helps me reason through node configs faster, but I decide the actual fix since it touches live CRM data.
5	Writing/refining the OpenAI prompt that scores lead Fit (1–10) in LeadGenius AI	Collaborate with AI	Prompt wording directly affects output quality — this needs iterative back-and-forth with AI, not a one-shot delegation.
6	Validating scraped/enriched lead data (ScrapingBee/Firecrawl output) before it hits HubSpot	Delegate to AI with review	AI can flag malformed or suspicious scrapes quickly, but I do a final check before anything reaches the CRM.
7	Drafting weekly FlyRank internship status update/report	Delegate to AI with review	The structure is repetitive and AI drafts it well from my notes; I edit for accuracy and tone before sending.
8	End-to-end testing of the HubSpot CRM integration (contact creation, field mapping)	Just me	This is a live-system check — I need to actually click through and verify, not trust a description of what “should” work.
9	Summarizing AI/ML research papers or blog posts for self-study (e.g., Deep RL)	Collaborate with AI	AI accelerates a first pass, but I re-derive key equations/concepts myself so I actually retain them.
10	Writing git commit messages and inline code documentation	Delegate to AI with review	Low-stakes, formulaic writing — AI drafts, I skim and adjust before committing.
11	Drafting emails to professors/mentors/internship team	Delegate to AI with review	AI gets tone and structure right quickly; I personalize details and always read before sending — these are relationships, not just text.
12	Building/reviewing small React/Node.js UI pieces for side projects	Collaborate with AI	Faster to iterate on components with AI, but I own the architecture and UX decisions.
13	Planning weekly priorities across coursework, internship, and side projects	Collaborate with AI	AI helps me see conflicts/overload in my task list, but the actual prioritization call is mine — it doesn't know what matters most to me.
14	Formatting/cleaning routine data tables (e.g., experiment result logs)	Fully automate	Purely mechanical, same steps every time, easy to verify the output is correct at a glance.

#	Task	Classification	Rationale
15	Searching for/collecting reference links and documentation while researching a new tool or library	Fully automate	Retrieval task with no judgment call — AI can do this end-to-end and I just click through what's relevant.

2. Toolkit Setup

- ✓ Claude account created at [claude.ai](#)
- ✓ ChatGPT account created at [chat.openai.com](#)
- ✓ Anthropic Academy account created; enrolled in AI Fluency: Framework & Foundations
- ✓ Completed Module 1

3. Claude Project — Custom Instructions

Project name: "Anil — AI Fluency Cohort"

I'm Anil Mali, a Bachelor of Engineering student in Artificial Intelligence & Data Science at KLE College of Engineering & Technology (VTU), and a Machine Learning intern at FlyRank AI in Bengaluru. I'm currently building LeadGenius AI, an automated CRM lead-qualification agent (n8n, OpenAI API, HubSpot, ScrapingBee/Firecrawl). I'm interested in Data Science, applied AI, and Deep Reinforcement Learning, and I work mainly in Python/PyTorch, React, and Node.js.

Tone: direct and technical, skip generic disclaimers, assume I know the fundamentals unless I say otherwise. Current goals: (1) build strong AI-collaboration habits for this fluency course, (2) ship LeadGenius AI, (3) grow as an ML engineer during my FlyRank internship.

4. Three Target Tasks for FL-02–FL-04

Target Task	"Done well" means
Prompt-tuning the LeadGenius AI Fit-Score node	The AI-generated Fit Score (1–10) agrees with my own manual judgment on ≥8 of 10 test leads, and the 2-sentence summary correctly reflects the company's actual business (no hallucinated details) on every test case.
Weekly FlyRank internship status report drafting	First AI draft needs ≤2 rounds of edits before it's send-ready, accurately reflects that week's actual work with zero fabricated claims, and takes under 10 minutes total (draft + review) versus writing from scratch.
Deep RL paper/concept summarization for self-study	I can explain the core idea back in my own words without notes afterward, the summary correctly identifies the paper's key contribution vs. prior work, and I catch at least one point where I'd push back on or want to verify the AI's explanation.
